iPhone Holder

Cell phone charging cable organization left a lot to be desired in our kitchen. The kitchen bench would be filled with cables and phones and it took up a lot of space and was very messy. Then, my family decided they had enough of the disorganized mess and decided to move the situation to an empty cabinet.

The plan was to mount the phones to the wall and use the external outlet to our advantage. The issue was how to mount the phones to the wall. I decided to design a model in Onshape that would hold the cell phones in place whilst charging them.

The final design supported magnetic and cord charging. The end result was super rewarding and satisfying when you could slide the phone down the holder and it would charge.

The project went through four iterations with varying dimensions and ways of tackling the problem. Design four isn't perfect but works to solve the problem. After the fourth iteration I decided that aesthetics were not necessary. I noticed that the space where the holes lightning/usb were oversized.

In conclusion, the project isn't perfect but serves its purpose and is robust and functional enough to be part of our daily routine. The project gave me more experience in the CAD software and more understanding of how to use dimensions of other products or designs to create an appropriate design for the matter
